Education:

EAS-LatAm webinar series will continue. Be sure to register for the third webinar!

The poster features a dark green background with a white grid pattern. At the top, the title "Triglyceride-rich lipoproteins as contributors to residual risk" is written in a large, bold, white font. Below the title, there are three circular portraits of speakers. On the left, two portraits are shown side-by-side: Prof. Laura Schreier and Prof. Alberto Zambon. On the right, a single portrait is shown for Prof. Pablo Corral, who is designated as the "Chair" of the webinar. Below the portraits, the date and time "Thursday, September 5 18:00-19:00 CET" are listed in white. Underneath that, it says "Free registration" and "Language: English and Spanish". At the bottom right, there are two logos: the SAL logo (a red circle with "SAL" in white) and the EAS LATAM logo (a red and white circle with "EAS LATAM" in white).

The atherogenic role of triglyceride-rich lipoproteins (TRL) and whether mild or moderate increases warrant pharmacological intervention have long been subjects of debate. Despite gaps in our understanding of the mechanisms behind residual risk, TRLs are thought to play a significant role. Improving our understanding of TRL's effects on the atherosclerotic process is essential for advancing our management of hypertriglyceridemia.

Join us for the third webinar in our joint EAS-LatAm series to explore this topic in depth. Register now!

Publications:

Recent issue highlights – May & June 2024

atherosclerosis

The May issue of Atherosclerosis contains several articles on the importance of imaging biomarkers in the diagnostics, prognostics, and monitoring of atherosclerotic cardiovascular diseases per se and as a reference for the evaluation of circulating biomarkers.

May issue vol. 392

ApoB containing lipoproteins are a causal risk factor of atherosclerotic cardiovascular disease. **This Newsletter summarizes several articles published in the June issue of Atherosclerosis** that addressed novel questions to the interaction of plasma levels of apoB containing lipoproteins with other risk factors in the determination of cardiovascular risk or treatment effectiveness, the effectiveness of familial hypercholesterolemia (FH) screening, the treatment of homozygous FH, or novel targets for cholesterol lowering therapies.

June issue vol. 393
